## 1 INTRODUCTION

This test report describes EMC tests on the product 4K2USB3:

- in compliance with electromagnetic compatibility directive 2014/30/EU as part of the requirements leading to the CE marking
- in compliance with FCC part 15 subpart B
- in compliance with ICES-003

The essential requirements of the directive 2014/30/EU are covered by the following harmonized standards:

- EN55032 (2015) A11 (2020) – *Electromagnetic compatibility of multimedia equipment - Emission requirements*
- EN55035 (2017) A11 (2020) – *Electromagnetic compatibility of multimedia equipment – Immunity requirements*

As per manufacturer declaration, there is no mechanical and electronical differences between 4K2USB3 and HD2USB3. HD2USB3 is a limited features edition of the 4K2USB3.

All qualification tests will be performed on 4K2USB3, which is considered a representative of HD2USB3 product.

## 4.3 EUT Setup Diagram

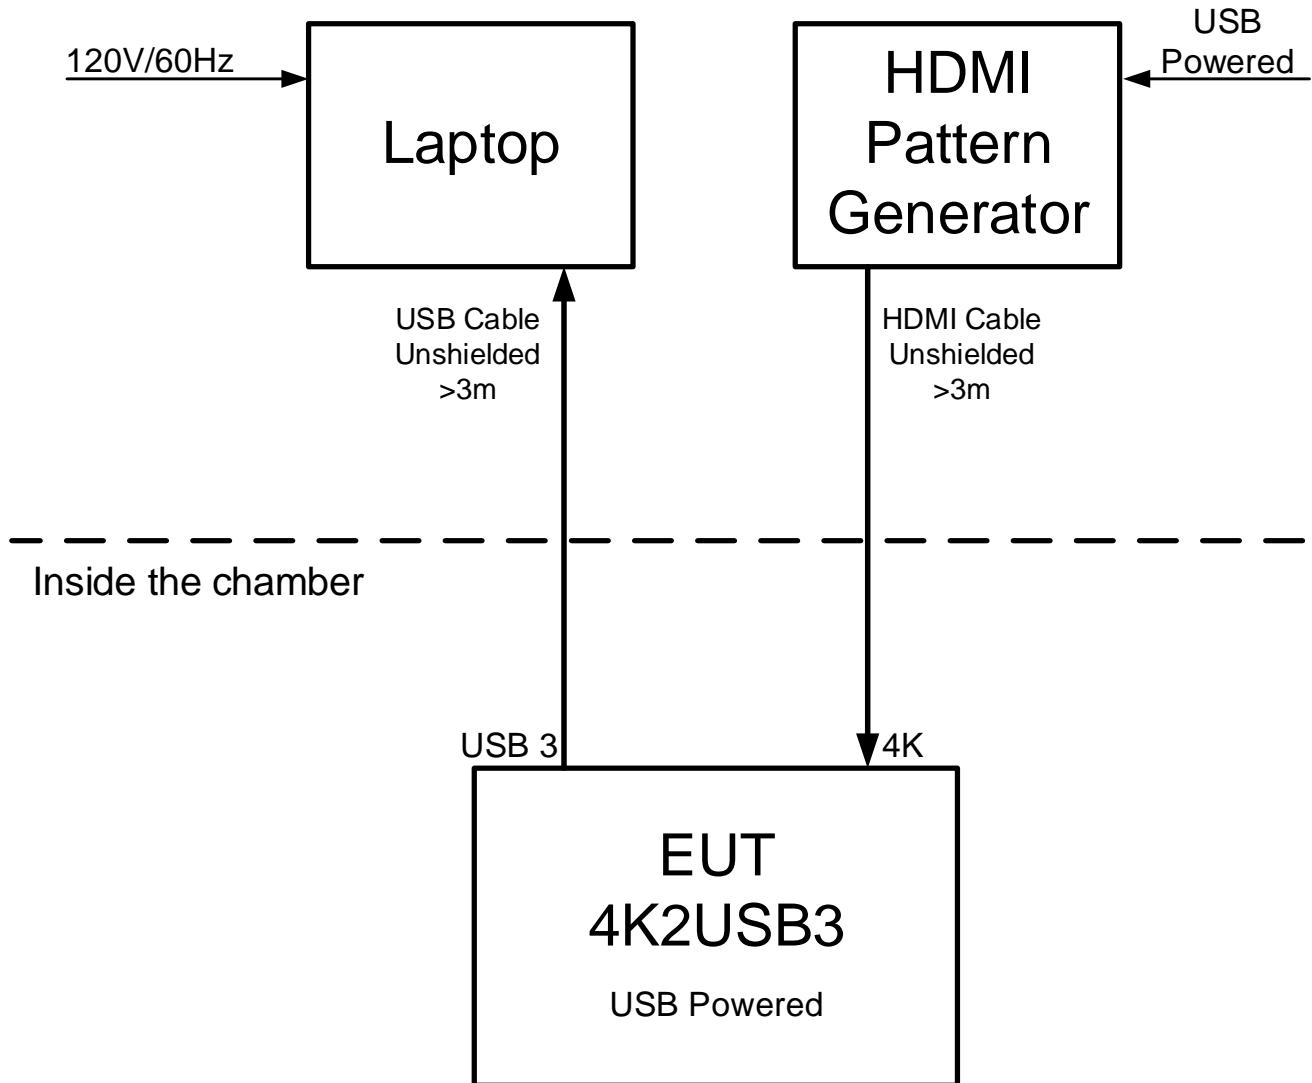

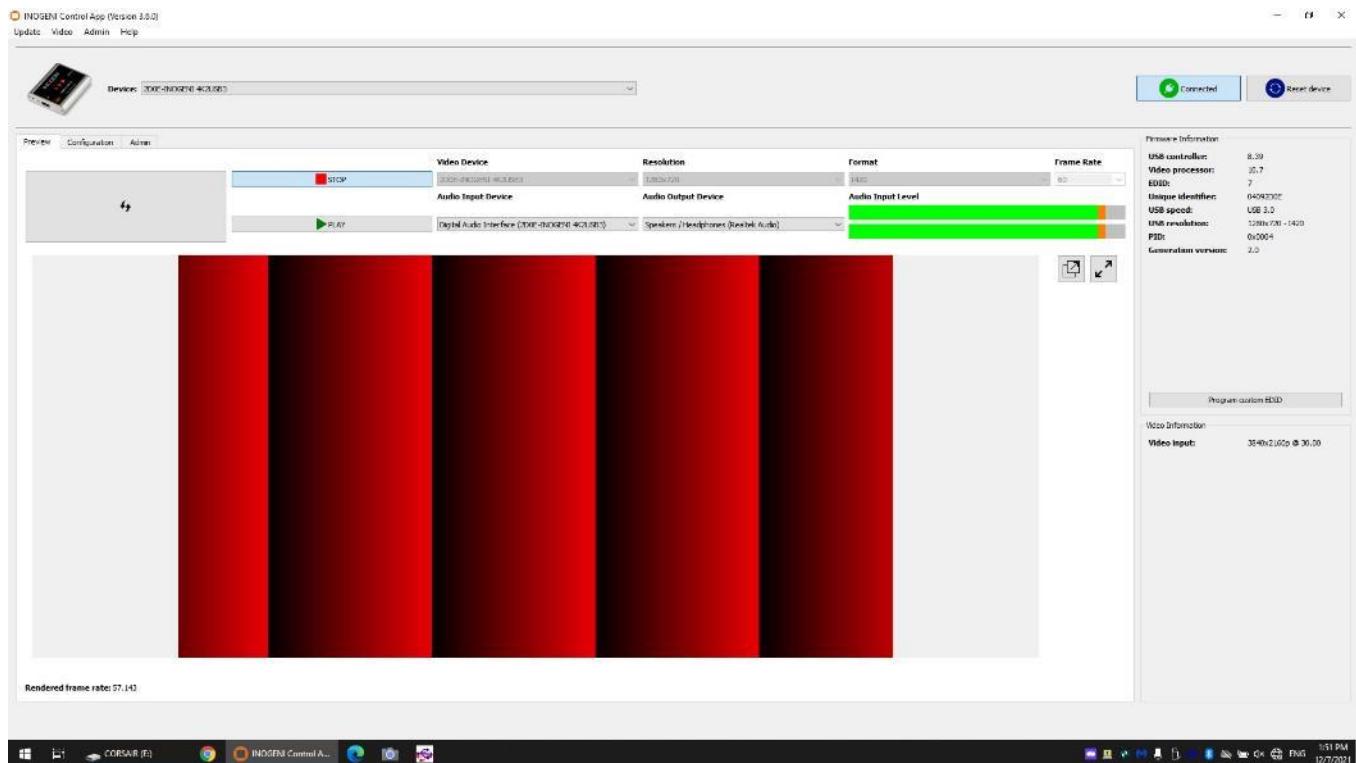

Figure 1: EUT Setup Diagram

#### 4.4 Mode of Operation

During the tests, the EUT forwards the data received from the HDMI Pattern Generator (HDMI, 4K30) to the Laptop (USB, HD). The frame rate is set to 60Hz.

Capture 1: Client Software

#### 4.5 Method of Monitoring

During the tests, the EUT was monitored by observing the picture and the Rendered Frame Rate on the software.

## 5 PERFORMANCE CRITERIA

During the tests, EUT shall operate normally, and the pattern displayed on the software has to be updated smoothly, without cuts in the streaming. The Rendered Frame Rate has to be higher than 30 frames per second.

The performance criteria for the evaluation of the immunity test results are defined by EN55035 standard (Electromagnetic compatibility of multimedia equipment – Immunity requirements).

*Performance criterion A: The equipment shall continue to operate as intended without operator intervention. No degradation of performance, loss of function or change of operating state is allowed below a performance level specified by the manufacturer when the equipment is used as intended. The performance level may be replaced by a permissible loss of performance. If the minimum performance level or the permissible performance loss is not specified by the manufacturer, then either of these may be derived from the product description and documentation, and by what the user may reasonably expect from the equipment if used as intended.*

*Performance criterion B: During the application of the disturbance, degradation of performance is allowed. However, no unintended change of actual operating state or stored data is allowed to persist after the test.*

*After the test, the equipment shall continue to operate as intended without operator intervention; no degradation of performance or loss of function is allowed, below a performance level specified by the manufacturer, when the equipment is used as intended. The performance level may be replaced by a permissible loss of performance.*

*If the minimum performance level (or the permissible performance loss), or recovery time, is not specified by the manufacturer, then either of these may be derived from the product description and documentation, and by what the user may reasonably expect from the equipment if used as intended.*

*Performance criterion C: Loss of function is allowed, provided the function is self-recoverable, or can be restored by the operation of the controls by the user in accordance with the manufacturer's instructions. A reboot or re-start operation is allowed. Information stored in non-volatile memory, or protected by a battery backup, shall not be lost.*

## 6 CALCULATION OF THE COMPLIANCE MARGIN

Conducted Emission Level (dB $\mu$ V) =	Value Reading at the EMI receiver (dB $\mu$ V) + Correction Factor (dB)
Correction Factor (dB) =	LISN Attenuation (dB) + Cable Loss (dB) – Amplifier Gain (dB) + Attenuator (dB)
Margin (dB) =	Conducted Emission Level (dB $\mu$ V) – Limit Value (dB $\mu$ V)

**Table 1: Example of Conducted Emissions Margin Calculation**

Radiated Emission Level (dB $\mu$ V/m) =	Value reading at the EMI receiver (dB $\mu$ V) + Antenna Factor (dB/m) + Correction Factor (dB)
Correction Factor (dB) =	Cable Loss (dB) – Amplifier Gain (dB) + Attenuator (dB)
Margin (dB) =	Radiated Emission Level (dB $\mu$ V/m) – Limit Value (dB $\mu$ V/m)

**Table 2: Example of Radiated Emissions Margin Calculation**

## 7 MEASUREMENT UNCERTAINTIES

All measurements under compliance testing, involve certain levels of uncertainties based on test equipment and facilities. The measurement uncertainties of National Technical Systems Canada Inc. ( $U_{LAB}$ ) were calculated according to CISPR16-4-2 standard and were lower than the maximum allowed by the standard ( $U_{CISPR}$ ). Therefore, the measurement uncertainties need not to be considered for compliance.

The following table presents uncertainty calculation for emission measurements as requested by ANSI C63.4 (2014):

Test	Expanded Uncertainty with k=2 Coverage Factor (95% Confidence Level)
Conducted Emissions with LISN (9kHz-150kHz)	$\pm 3.77$ dB
Conducted Emissions with LISN (150kHz-30MHz)	$\pm 3.33$ dB
Radiated Emissions (30MHz-1GHz)	$\pm 5.87$ dB
Radiated Emissions (1GHz-18GHz)	$\pm 5.10$ dB

**Table 3: Measurement Uncertainties**

All other calculations of uncertainties evaluation are available upon request.

## 8 ENGINEERING COMMENTS

### 8.1 Modifications incorporated in the EUT

No modification was performed on the EUT during testing.

### 8.2 Deviations from the standards and/or laboratory tests procedure

No deviation from standards and/or test laboratory procedure was performed during testing.

## 9 TEST SUMMARY

The following table lists all tests called by the harmonized standards indicated in the test report introduction.

### 10.1.5 Test Method

Radiated emissions were performed using the procedures of the reference standard.

Once the configuration or mode of operation causing the highest emission level (worst case) was determined, spectral previews were performed with the Peak detector in the frequency range specified by the reference standard.

Frequencies where level was above the limit or within 10 dB of the limit were recorded. The level at these frequencies was maximized and measured with the detector specified by the limit.

#### 11.1.5 Test Method

Electrostatic discharge immunity tests were performed using the procedures of the reference standard.

Application of direct discharges was applied to points and surfaces of EUT which are accessible to person during normal use. If contact discharge cannot be applied, the air discharge method shall be performed.

Application of indirect discharges was applied to the horizontal coupling plane (0.1m from the front of EUT) and to vertical coupling plane (VCP is positioned at 0.1m from EUT in order to illuminate the four faces of EUT).

REFERENCE STANDARD	IEC61000-4-3 (2020)	
SPECIFICATIONS		
TEST	#1	
Frequency Range	80MHz-1000MHz	
Test Level	3V/m	
Test Distance	2m	
Uniformity Field Area	1.5m x 1.5m	
Modulation	AM 80% / 1kHz	
Frequency Step	1%	
Dwell Time	0.5s	
TEST	#2	#3
Frequencies	1800MHz, 2600MHz	3500MHz, 5000MHz
Test Level	3V/m	1V/m
Test Distance	2m	2.7m
Uniformity Field Area	1.5m x 1.5m	1.5m x 1.5m
Modulation	AM 80% / 1kHz	
Dwell Time	10s	
Illuminated Face	6	
Installation	Table-top equipment	
PERFORMANCE CRITERION	A	

<b>EUT</b>	
<b>Identification</b>	4K2USB3
<b>Voltage Input</b>	USB Powered
